                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alkylating 2' position of 2',3'-dihydroxy sugar molety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dipydroxy sugar moleties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide
a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "2'-dimethylaminooxyethyl thymidine (T-2'DMAOE)"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-0-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                             Dihydroxy sugar moiety, 2'-O-alkyl nucleotide, hybridisation affinity, nuclear resistance, alkylation, therapeutic, diagnostic, ss.
                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                 Oligonucleotide #23 used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                  Dihydroxy sugar moiety, 2'-O-alkyl nucleotide, hybridisation affinity;

                                                                                                                                                                                                                                                                                                                    Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester.
                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of a ligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                 'note= "2'-dimethylaminooxyethyl thymidine (T-2'DMAOE)"

Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of alignmentic compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Dihydroxy sugar moiety, 2'-O-alkyl nucleotide, hybridisation affinity, nuclear resistance, alkylation, therapeutic; diagnostic; ss.

                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                 Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming,
                                                                                                                                                                                   The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with base, warming, cooling and reacting with nucleotides, nucleosides and nucleoside surrogates used for preparation of 1'-0-alkyl nuclear compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Dihydroxy sugar moiety; 2'-O-alkyl nucleotide; hybridisation affinity; nuclear resistance; alkylation; therapeutic; diagnostic; ss.

Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming,
                                                                                                                                                                                                                                         The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Dihydroxy sugar moiety, 2'-O-alkyl nucleotide, hybridisation affinity; nuclear resistance, alkylation, therapeutic; diagnostic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                               The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a novel method of selective alkylation of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of 1'-O-alkyl of oligomeric compounds having improved hybridisation affinity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "2'-dimethylaminooxyethyl thymidine (T-2'DMAOE)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dihydroxy sugar moiety; 2'-0-alkyl nucleotide; hybridisation affinity; nuclear resistance; alkylation; therapeutic; diagnostic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotide #12 used to illustrate the method of the invention.

in comparison with the known 2'-O-(2-methoxyethyl) (2'-O-MOE) modification. The 2'-O-MTE modified oligonuclectides exhibited similar binding affinity to target RNA as their 2'-O-MOE equivalent while binding to human serum albumin was improved. The modification can be used to modulate the pharmacokinetics of oligonucleotides, e.g. in antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to oligomeric compounds having at least one nucleoside. The compounds are useful for therapeutic and investigative purposes and for treating hepatitis C virus infection. The compounds having 2'-0-modifications increases their affinity and nuclease resistance. This sequence represents an oligomeric compound of the

```
The invention relates to oligomeric compounds having at least one nucleoside. The compounds are useful for therapeutic and investigative purposes and for treating hepatitis C virus infection. The compounds having 2'-O-modifications increases their affinity and nuclease resistance. This sequence represents an oligomeric compound of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                          ö
                                                                                                                                                   This invention relates to novel synthetically modified oligomers that have increased nuclease resistance and have enhanced hybrid binding. Such oligomers are useful for diagnostic and therapeutic uses such as antisense technologies. The invention also discloses a method for the preparation of the oligomers with modifications as fully defined in the specification. The present sequence represents a synthetically modified oligonucleotide of the invention.
                                                                                                   Guanidinium functionalized oligonucleotides used for diagnostic, therapeutic or investigative purposes comprises a number of nucleotide

                                              This invention relates to novel synthetically modified oligomers that have increased nuclease resistance and have enhanced hybrid binding. Such oligomers are useful for diagnostic and therapeutic uses such as antisense technologies. The invention also discloses a method for the preparation of the oligomers with modifications as fully defined in the specification. The present sequence represents a synthetically modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to novel synthetically modified oligomers that have increased nuclease resistance and have enhanced hybrid binding. Such oligomers are useful for diagnostic and therapeutic uses such as an antisense technologies. The invention also discloses a method for the preparation of the oligomers with modifications as fully defined in the specification. The present sequence represents a synthetically modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Guanidinium functionalized oligonucleotides used for diagnostic,
therapeutic or investigative purposes comprises a number of nucleotide
units.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes an oligonucleotide comprising several nucleotides covalently linked together by internucleotide linkages. At least one of the uncleotides is linked to an adjacent nucleotide by 2',5'. The uncleotide is linked to an adjacent nucleotide by 2',5'. The uncleotide linkage and bears a 3'-substituent. The oligonucleotides in thermucleotide linkage and hears a 3'-substituent. The oligonucleotides are useful; as antisense oligonucleotides; in pharmaceutical compositions of for treating organism having disease caused by undesired production of protein e.g. organism that utilises RNA-DNA transcription or RNA-Protein translation, bacteria, yeast, protozoa, algae and warm-blooded animals; of for developing diagnostic and therapeutic agents. The modified oligonucleotide exhibits improved properties of nuclease resistance and configuration of properties of nuclease resistance and exhibit configuration of action. This sequence represents an oligonucleotide of the
                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide comprising at least one 2',5'-internucleotide linkage useful for treating organisms having disease caused by undesired production of protein e.g. bacteria, yeast, protozoa and algae.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel oligonucleotides comprising several nucleotide units which are specifically hybridisable with a selected sequence of RNA or DNA wherein at least one of the nucleotide moieties of the oligomer is modified to include a guanidinium group. These oligonucleotides are useful for diagnostic, therapeutic and investigative purposes. The present sequence is an oligonucleotide used in the exemplification of the invention.

```

```
New oligomers containing guanidinium groups, useful for modulating gene expression by hybridizing oligomer with single- or double-stranded nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               several nucleotide units which are specifically hybridisable with a selected sequence of RNA or DNA wherein at least one of the nucleotide moieties of the oligomer is modified to include a guanidinium group. These oligonucleotides are useful for diagnostic, therapeutic and investigative purposes. The present sequence is an oligonucleotide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel oligonucleotides comprising
        Oligonucleotide #5 used in the exemplification of the invention
                                                                                                                                                                                                                                                                                  /note= "2'-0-[2-(guanidinium)ethyl] thymidine"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.7%; Score 19; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligomers containing guanidinium groups, useful for modulating gene expression by hybridizing oligomer with single- or double-stranded nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel oligonucleotides comprising several nucleotide units which are specifically hybridisable with a selected sequence of RNA or DNA wherein at least one of the nucleotide moieties of the oligomer is modified to include a guanidinium group. These oligonucleotides are useful for diagnostic, therapeutic and investigative purposes. The present sequence is an oligonucleotide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                             Oligonucleotide #11 used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                            The invention relates to a guanidinium functionalised nucleotide compounds. The guanidinium functionalised nucleotide compounds are used for preparation of oligomers useful for diagnostic, therapeutic and investigative applications. The 2-0-guanidinium ethyl modification increases binding affinity to a target. The present sequence represents a guanidinium functionalised oligonucleotide.
                                                                                                                                            New guanidinium functionalized nucleotide compounds useful for preparing oligomers used for diagnostic, therapeutic and investigative

New guanidinium functionalized nucleotide compounds useful for preparing oligomers used for diagnostic, therapeutic and investigative
                                                                                                                                                    The invention relates to a guanidinium functionalised nucleotide compounds. The guanidinium functionalised nucleotide compounds are used for preparation of oligomers useful for diagnostic, therapeutic and investigative applications. The 2-O-guanidinium ethyl modification increases binding affinity to a target. The present sequence represents guanidinium functionalised oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /mod_base= OTHER

The invention relates to 2'-O-aminoethylthioethyl-modified ribosyl nucleosides. The modified ribosyl nucleosides are used as monomers for the synthesis of modified antisense oligonucleotides, which are useful in diagnosis and therapeutics (e.g. in gene therapy, for treating organisms having a disease associated by the undesired production of proteins) and as research reagents. The oligonucleotides obtained from the monomers show enhanced hybrid binding affinity towards targeted DNA or RNA and resistance towards nucleases. This sequence represents a modified antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New 2'.-O-aminoethylthioethyl-modified ribosyl nucleosides useful ar
monomer for the synthesis of modified anti-sense oligonucleotides.

                                                                  ๙
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to 2'-O-aminoethylthioethyl-modified ribosyl nucleosides. The modified ribosyl nucleosides are used as monomers for the synthesis of modified antisense oligonucleotides, which are useful in diagnosis and therapeutics (e.g. in gene therapy, for treating organisms having a disease associated by the undesired production of proteins) and as research reagents. The oligonucleotides obtained from the monomers show enhanced hybrid binding affinity towards targeted DNA or RNA and resistence towards nucleases. This sequence represents a modified antisense oligonucleotide of the invention.
compounds. The guanidinium functionalised nucleotide compounds are used for preparation of oligomers useful for diagnostic, therapeutic and investigative applications. The 2-0-guanidinium ethyl modification increases binding affinity to a target. The present sequence represents guanidinium functionalised oligonucleotide.

The invention relates to nucleoside compounds. The nucleoside compounds are useful as antisense compounds in diagnostics, therapeutics, prophylaxis, and as research reagents and kits, and to prevent or delay infection, inflammation or tumour formation. The compounds have enhanced binding affinity properties. The present sequence represents a 2'-0-MOE-2-thio modified oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER /note= "Modified with 2'-O-[2-(2-N,N-dimethylaminoethyl) oxyethyl]-5-methyl uridine"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a nanotube (I) attached with one or more nucleic acid molecule(s). Also described: (1) chemically modifying (M1) a nanotubes; (2) physically modifying (M2) a nanotubes; (3) linking (M3) annotubes; (2) physically modifying (M2) a nanotubes; (3) linking (M3) annotubes; (4) a several linked nanotubes (II) produced by (M3); (5) directing (M4) nanotubes to specific targets; (6) a nucleic acid sensor (III) comprising (I), where the base sequence of the attached nucleic acid molecules being detected; (7) a DNA array consisting of an array of groups of one or more nucleic acid molecules being detected; (7) a DNA array consisting of an array of groups of one or more nucleic acid molecules of the same base sequence attached to each nanotubes in the group, and where the base sequence of the nucleic acid molecules, attached to the nanotubes in one group attached to acid molecules, attached to the nanotubes in one group and membrane support to which the DNA-molecules are attached; and a membrane support to which the DNA-modified nanotubes are attached; and conductor (IV) comprising (I). (I) is useful in coating one or more nanotubes with nanoparticles, which involves exposing (I) and a molecules, where the nanoparticles, which involves exposing (I) to comprising several attached complementary nucleic acid molecules, where the nanoparticles hybridise to the nucleic acid molecules, forming one or more coated nanotubes. (I) can be coher nanoparticles, forming one or more coated nanotubes. (I) can be coher nanoparticles, forming one or more coated nanotubes. (I) can be coher nanoparticles, in pharmaceutical applications, agricultural captured and control, hygiene and environmental monitoring and control, bygiene and environmental monitoring and control, applications, agricultural component in plant in a component in plant in a component in a component in plant in a component in a component in a component in the conductor or component in plant in a component in plant in a component in plant in a c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                         Carbon nanotube attached with one or more nucleic acid molecules, useful as biosensor for screening presence of bacterial or viral nucleic acid in clinical samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  semiconductor, more specifically as a component in nano-electronic applications, as a replacement for damaged nerves in prostatic applications, or as the bio-electronic interface in bio-electronic devices. (II) can also be used as a transistor or gated device. The present sequence represents an oligonucleotide which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

An isolated nucleic acid molecule, comprising nucleic acid sequence of
Nicotiana derived cytochrome P450 enzyme fragments, useful for producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid molecule (I), comprising a nucleic acid sequence chosen from 75 Nicotiana-derived cytochrome P450 enzyme fragment sequences. (I) is useful for producing a
                                                                                                                                                                                                                             enhancing renal uptake of an oligomeric compound. The method is useful for enhancing renal uptake of an oligomeric compound. The sequences of the invention are useful in diagnostics, therapeutics and as research reagents; and for treating infection caused by organisms (e.g. bacteria, yeast, protozoa and algae) in plants and higher animals. The present of 2'-O-modified oligomers. This sequence is used to illustrate enzymatic degradation method of the invention.
                                                                                                               Enhancing renal uptake of an oligomeric compound in the diagnostic and therapeutic applications involves incorporating at least one modified ribosyl nucleoside into the oligomeric compound.
                                                                                                                                                                                                                 The invention relates to 2'-0-modified ribosyl nucleosides and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                       The invention relates to 2'-O-modified ribosyl nucleosides and methods of enhancing renal uptake of an oligomeric compound. The method is useful for enhancing renal uptake of an oligomeric compound. The sequences of the invention are useful in diagnostics, therapeutics and as research reagents; and for treating infection caused by organisms (e.g. bacteria, yeast, protozoa and algae) in plants and higher animals. The present sequence is an oligomucleotide used in animal studies. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                         Enhancing renal uptake of an oligomeric compound in the diagnostic and therapeutic applications involves incorporating at least one modified ribosyl nucleoside into the oligomeric compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     to illustrate enzymatic degradation of 2'-0-modified oligomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

transgenic tobacco plant, which involves operably linking (I) with a promoter functional in the plant to create a plant transformation vector, and transforming the plant with the plant transformation vector, selecting a plant cell transformed with the transformation vector, and regenerating a plant from the selected plant cell. The nucleic acid molecule is in an antisense orientation, sense orientation or is in a RNA interference orientation. The present sequence represents a PCR primer used to clone DNA encoding tobacco cytochrome P450 enzyme fragments of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense

The invention describes a RNA interference (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense cone or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (MI) apo8-100 cevels or glucose-6-phosphatase levels in a subject; producing (I); including (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and adevice that can be dispense or administer a composition comprising (I). (I) is useful for reducing apo8-100 levels or glucose-6-phosphatase levels.

CC useful for reducing apo8-100 levels or glucose-6-phosphatase levels.

The subject is suffering from a disorder characterised by elevated or coherwise unwanted expression of apol-100, elevated or otherwise unwanted contains and or disersed cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance,

CM sellidaemias, hypercholesterolaemia, statin-resistant

CM physicholesterolaemia, coronary artery disease (CMD), coronary heart disease (CMD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or spinocerbellar ataxia) or viral disease (e.g., Huntington or ligonucleotide that can creating the patitis C virus (RCV) antisense oligonucleotide that can control HCV gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic; anticonvulsant; nostropic; muscula; anti-HIV; RNA interference; iRNA; antisense technology; lipid metabolism; conclesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose metabolism-related disorder; dasease; colon cancer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; ADDS; hepatitis C virus; HCV; ss.

The invention describes a kWA interference (iKMA) agent (1) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical phosphotochioate modifications come or more asymmetrical phosphotochioate modifications and the antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 (control one or more asymmetrical modification in the sequence, where the modification do not more asymmetrical modification in the sequence, where the modification do not not not a device the modification decreasing (1); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (1) and instruction for its use; and a device that can be dispense or administer a composition comprising (1). (1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) (context) sequence is suffering from a disorder characterised by elevated or cherwise unwanted expression of apoB-100, elevated or cherwise unwanted levels of cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, hypercholesterolaemia, statin-resistant characteriae cholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (1) is administered to a subject to inhibit hepatic glucose production or for treating the diseases as mentioned above, cancer (e.g. breast, colon or clump acheen a hepatitis C viral disease (e.g., AIDS). This sequence represents a hepatitis C viral (120) antisense oligonucleotide that can control HCV gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention describes a RNA interference (iRNA) agent (I) comprising a

(ALNY-) ALNYLAM PHARM

Manoharan M, Bumcrot D;

WPI; 2004-677362/66.

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 6760; 378pp; English.

come or more asymmetrical 2'-0 alkyl modifications, the sense sequences have one or more asymmetrical 19-0 alkyl modifications, the antisense cone or more asymmetrical phosphorothioate modifications cone or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 cc levels or glucose-6-phosphatase levels in a subject; producing (II); clavels or glucose-6-phosphatase levels in a subject; producing (II); clavels or more asymmetrical modification in the sequence, where introducing one or more asymmetrical modification in the sequence, where crete modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (C) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (C) cherwise unwanted expression of apoB-100, elevated or otherwise unwanted correspondent or dispense or type-2 dispense (GD) inhibit hepatic glucose production or for treating glucose-engage or dispense or type-2 invention describes a RNA interference (iRNA) agent (I) comprising a

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 6758; 378pp; English

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-0 alkyl modifications, the antisense can demonstrated to a sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); reducing (I); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

The subject is suffering from a disorder characterised by elevated or cherwise unwanted expression of apoB-100, elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted disorder is chosen from the HDL/DD. cholasterol imbalance, dyslipidaemias, hypercholestorolasmia, statin-resistant for cholesterolaemia, coronary artery disease (CAD), coronary heart of sisease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism.

The subject diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Hutrington disease or capmocration or interesting succession or spinocerbellar ataxia) or viral disease (e.g., AIDS). This sequence contractive coronary artery disease (e.g., AIDS). This sequence

pharmaceutical composition comprising (1); and a device for administering (1) into a patient. (1) is useful for reducing apoB-100 levels or glucose -6-phosphatase levels in a subject. (1) targets a sequence identical to any one of sequences as given in the specification. (1) comprises a cholesterol moiety is coupled to a sense strand. (2) further comprises a second cholesterol moiety. The second cholesterol moiety is coupled to a sense strand. (1) has 10 or more nucleotides. The duplex region of (1) is 19 nucleotides in length. The subject is suffering from a disorder having elevated or otherwise unwanted evels of cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from HDL/LDL cholesterol imhalance, dyslipidaemia (e.g., familial combined hyperlipidaemia or acquired hyperlipidaemia, coronary the cholesterolaemia, statin resistant hypercholesterolaemia, coronary at the cholesterolaemia statin resistant hypercholesterolaemia, coronary at the cholesterolaemia statin resistant hypercholesterolaemia, coronary at the cholesterolaemia statin resistant hypercholesterolaemia. ô artery disease, coronary heart disease and atherosclerosis, preferably statin-resistant hypercholesterolaemia. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorders e.g., type-2 diabetes or glitaxone-resistant diabetes. (I) has endonuclease or exonuclease resistance. This sequence represents a human hepatitis C virus polynucleotide associated with the inhibition of HCV in human liver cells. antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; interference RNA; iRNA; cholesterol moiety; apoB; glucose-6-phosphatase; lipid metabolism; cholesterol imbalance; dyslipidaemia; familial combined hyperlipidaemia; acquired hyperlipidaemia; hypercholesterolaemia; statin-resistant hypercholesterolaemia; coronary artery disease; coronary heart disease; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; type-2 diabetes; glitaxzone-resistant diabetes; HCV; hepatitis C virus; antisense inhibition; ss. Hepatitis C virus. WO2004091515-A2. 28-OCT-2004.

```
The invention describes an interference RNA (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequence comprises one or more cholesterol moieties, and the antisense sequence comprises one or more cholesterol moieties, and the antisense sequence categors a human gene sequence. The following are disclosed: a pharmaceutical composition comprising (I); and a device for administering complements of sequences as given in the specification. (I) comprises a cholesterol moiety is coupled to a sense strand.

(I) further comprises a second cholesterol moiety. The second cholesterol moiety is coupled to a sense strand.

(I) further comprises a second cholesterol moiety. The second cholesterol moiety is coupled to a sense strand.

(I) further comprises a second cholesterol moiety. The second cholesterol complexity is 19 mucleotides in length. The second cholesterol complexity is 19 mucleotides in length. The subject is suffering from a disorder having elevated or otherwise unwanted levels of expression of (I) is 19 mucleotides in length. The subject is suffering from a disorder having elevated or or otherwise unwanted cholesterol complexity is combined hyperlipidaemia or acquired hyperlipidaemia, statin-resistant hypercholesterolaemia, statin-resistant hypercholesterolaemia, statin-resistant disease, coronary artery disease, coronary heart disease and atherosclerosis, preferably statin-resistant hypercholesterolaemia. (I) is administered to a subject columbia hepatic glucose production or for treating glucose-metabolism-calarded and human hepaticis (Virus polymucleotide associated with the inhibition of the human is a human hepaticis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                     New interference RNA agent comprising sense sequence and antisense sequence having cholesterol moieties, useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                interference RNN; IRNA; cholesterol moiety; apoB; glucose-6-phosphatase; lipid metabolism; cholesterol imbalance; dyslipidaemia; familial combined hyperlipidaemia; acquired hyperlipidaemia; hypercholesterolaemia; statin-resistant hypercholesterolaemia; coronary artery disease; coronary heart disease; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; type-2 diabetes; glitaxzone-resistant diabetes; HCV; hepatitis C virus; antisense inhibition; ss.

comprises one or more cholesterol moieties, and the sense sequence comprises one or more cholesterol moieties, and the antisense sequence targets a human gene sequence. The following are disclosed: a comprise to pharmaceutical composition comprising (1); and a device for administering pharmaceutical composition comprising (1); and a device for administering (2) into a patient. (1) is useful for reducing apos-100 levels or glucose of phosphatase levels in a subject. (1) targets a sequence identical to any one of sequences as given in the specification. (1) comprises a coholesterol moiety is coupled to a sense strand. (2) further comprises a second cholesterol moiety. The subject is moiety is coupled to a sense strand. (1) has 21 or more nucleotides. The ouplex region of (1) is 19 nucleotides in length. The subject is suffering from a disorder having elevated or otherwise unwanted evels of expression of apo-8-100, elevated or otherwise unwanted levels of cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from HDL/LDL cholesterol imbalance, dyslipidaemia (e.g., familial combined hyperlipidaemia or acquired hyperlipidaemia, statin-resistant hypercholesterolaemia, cononary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New interference RNA agent comprising sense sequence and antisense sequence having cholesterol moieties, useful for reducing apoB-100 levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes an interference RNA (iRNA) agent (I) comprising a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sense sequence and an antisense sequence, where the sense sequence comprises one or more cholesterol moieties, and the antisense sequence comprises one or more cholesterol moieties, and the antisense sequence targets a human gene sequence. The following are disclosed: a characterical composition comprising (1); and a device for administering (1) into a patient. (1) is useful for reducing apos-100 levels or glucose (1) into a patient. (1) is useful for reducing apos-100 levels or glucose of sequences as a subject. (1) targets a sequence identical to cany one of sequences as given in the specification. (1) comprises a cond cholesterol moiety is coupled to a sense strand. (1) has 21 or more nucleotides. The cholesterol moiety is coupled to a sense strand. (1) has 21 or more nucleotides. The cuplex region of (1) is 19 nucleotides in length. The subject is suffering from a disorder having elevated or otherwise unwanted confidence and/or disregulation of lipid metabolism. The disorder is cholesterol, and/or disregulation of lipid metabolism. The disorder is combined hyperlipidaemia or acquired hyperlipidaemia),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New interference RNA agent comprising sense sequence and antisense sequence having cholesterol moieties, useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
                                                                                                                                                                                                                                                                                                                                                                  interference RNA; iRNA; cholesterol moiety; apoB; glucose-6-phosphatase; lipid metabolism; cholesterol imbalance; dyslipidaemia; demilial combined hyperlipidaemia; acquired hyperlipidaemia; coronary artery disease; coronary heart disease; atherosclerolaemia; coronary artery disease; coronary heart disease; atherosclerosis; type-2 diabetes; glicaxzone-resistant disease; atherosclerosis; type-2 diabetes; glicaxzone-resistant diabetes; HCV; hepatitis C virus; antisense inhibition; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes an interference RNA (iRNA) agent (I) comprising

hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease, coronary heart disease and atherosclerosis, preferably statin-resistant hypercholesterolaemia. (i) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorders e.g., type-2 diabetes or glitaxzone-resistant diabetes. (I) has endonuclasse or exonuclasse resistant diabetes a human hepatitis C virus polynuclassic resistant diabetes. Human hepatitis C virus polynuclassic associated with the inhibition of HCV in human liver cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; interference RNA; iRNA; cholesterol moiety; apoB; glucose-6-phosphatase; lipid metabolism; cholesterol imbalance; dyslipidaemia; familial combined hyperlipidaemia; acquired hyperlipidaemia;

                                 The invention describes an interference RNA (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequence comprises one or more cholesterol moieties, and the antisense sequence comprises one or more cholesterol moieties, and the antisense sequence cc targets a human gene sequence. The following are disclosed:

targets a human gene sequence. The following are disclosed:

targets a human gene sequence. The following are disclosed:

comprises one or more momental for reducing apoB-100 levels or glucose comparate levels in a subject. (I) targets a sequence identical to any one of sequences as given in the specification. (I) comprises a cholesterol moiety is coupled to a sense strand.

Complex region of (I) is 19 nucleotides in length. The subject is suffering from a disorder having elevated or otherwise unwanted complex region of (I) is 19 nucleotides in length. The subject is suffering from a disorder having elevated or otherwise unwanted evels of cholesterol, and/or disregulation of lipid metabolism. The disorder is combined hyperlipidaemia or acquired hypercholesterolaemia, (C) hypercholesterolaemia, statin-resistant hypercholesterolaemia, statin-resistant theoreticosis, preferably creating resistant hypercholesterolaemia, (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism.

Conditions of sequence are sestance. This sequence represents a human hepatitis C virus polynuclease resistance. This sequence represents con thuman hepatitis C virus polynuclease resistance. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

comprises one or more cholesterol moieties, and the antisense sequence comprises one or more cholesterol moieties, and the antisense sequence comprises one or more cholesterol moieties, and the antisense sequence targets a human gene sequence. The following are disclosed: a pharmaceutical composition comprising (1); and a device for administering (1) into a patient. (1) is useful for reducing apoB-100 levels or glucose e-phosphatase levels in a subject. (1) targets a sequence identical to any one of sequences as given in the specification. (1) comprises a cholesterol moiety. The coupled to a sense strand. (1) further comprises a second cholesterol moiety. The second cholesterol moiety is coupled to a sense strand. (1) has coupled to a sense strand. (1) has considered a sense strand. (2) cuplex region of (1) is 19 nucleotides in length. The subject is suffering from a disorder having elevated or otherwise unwanted exposession of apo-B-100, elevated or otherwise unwanted levels of cholesterol, and/or disregulation of lipid metabolism. The disorder is combined hyperlipidaemia or acquired hyperlipidaemia (e.g., familial combined hyperlipidaemia or acquired hyperlipidaemia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New interference RNA agent comprising sense sequence and antisense sequence having cholesterol moieties, useful for reducing apob-100 levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to inhibit hepatic jucose production or for treating glucose-metabolism-related disorders e.g., type-2 diabetes or glitaxzone-resistant diabetes (I) has endonuclease or exonuclease resistance. This sequence represents a human hepatitis C virus polynucleotide associated with the inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease, coronary heart disease and atherosclerosis, preferably statin-resistant hypercholesterolaemia. (I) is administered to a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes an interference RNA (iRNA) agent (I) comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to a novel chemically synthesized double stranded short interfering nucleic acid molecule that directs cleavage of a signal transducer and activator of transcription 3 (57473) RNA by RNA contransducer and activator of transcription 3 (57473) RNA by RNA contransducer and activator of turther includes a composition comprising the short interfering nucleic acid has cytostatic, antiporiatic, dermatological, antinflammatory, and gastrointestinal-Gen. activities. The short interfering nucleic acid or its composition is useful for treating, inhibiting, or reducing cancer, proliferative, and/or preventing, inhibiting, or reducing cancer, proliferative, and/or such as psoriasis, eczema, disorders, or conditions in a subject or organism, such as psoriasis, eczema, dermatilis, Crohn's disease, and inflammatory bowel disease, and for any other disease, trait, or condition that is celated to or will respond to the levels of STT31 in a cell or tissue, alone or in combination with other treatments or therapies. This oligo sequence represents a STAT-3 siRNA strand of the invention.
The invention relates to nucleosides/oligonucleotides (I) modified at 2'

CC position by linker-bound support including nucleosides containing

CC position by linker-bound support including nucleosides containing

CC therapeutics and as research reagents and kits. The method is useful in diagnostics,

the preparation of antisense oligonucleotides that can be directed

CC the preparation of antisense oligonucleotides that can be directed

CC dagainst a target messenger RNA sequence or alternatively against a target

CC omplementary. They are useful for treating organisms having a disease

CC chemical and biophysical properties for cellular membrane penetration

C. they are capable of improving cellular lipid bilayers penetrating

CC chemical as wall as resistance to exonuclease and endonuclease

CC degradation in vivo. (I) mitigate potential problems such as very short

CC biological half-lives due to degradation by nucleases, inherent negative

CC charge and hydrophilic natural composition. The bioreversible protecting

CC cligonucleotides of natural composition. The bioreversible protecting

CC charge and hydrophilic natural sequence to the oligonucleotides and are removed

CC nuclean and hydrophile that in the cell cytosol extract by

CC charge and properties the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleoside/oligonucleotides modified at 2' position by linker-bound support including nucleosides containing bioreversible phosphate blocking linkages, useful as diagnostic, therapeutic and research reagents.
                                                                                                          internucleotide linkages between nucleotides 1-2,2-3,3-4,16-17,17-18,18-19 OR 2-(pivaloylthio)ethyl
phophotritester internucleotide linkages between 1-2,2-3,3-4-4-5,15-16,16,17,17-18,18-19 where nucleotides 1-4 and 15-18 are 2'-0-(2-methoxyethyl)thymidines"

                                                                                                             short interfering nucleic acid molecule that directs cleavage of a signal transducer and activator of transcription 3 (STAT3) RNA by RNA short interference. The invention further includes a composition comprising the short interfering nucleic acid has cytostatic, antipsoriatic, dermatological, antipital amentory, and gastrointestinal-Gen activities. The short interfering nucleic acid has cytostatic, antipsoriatic, dermatological, antipital amentory, and gastrointestinal-Gen activities. The short interfering nucleic acid or its composition is useful for treating, preventing, inhibiting, or reducing cancer, proliferative, and/or inflammatory disease, dermatitis, Crohn's disease, and inflammatory bowel disease, and for any other disease, trait, or condition that is related to or will respond to the levels of STAT3 in a cell or tissue, sequence represents a STAT-3 siRNA strand of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New chemically modified double stranded short interfering nucleic acid (siRNA) molecule that directs cleavage of a NOGO receptor (NOGOr) RNA via
                                                                                The invention relates to a novel chemically synthesized double stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RNA interference, gene silencing, short interfering RNA, siRNA, nervous system injury, spinal cord injury, neuroprotective, vulnerary, cerebrovascular ischemia; cerebroprotective, multiple sclerosis; muscular dystrophy, muscular-gen., neuropathy, motor neurone disease, CNS-gen., ataxia; Parkinsons disease; antiparkinsonian; Huntingtons chorea; anticonvulsant, nootropic, dementia; Creutzfeldt Jakob disease; Alzheimers disease; NOGO receptor;

```
The invention relates to chemically synthesized short interfering nucleic acids (sinAs) which downregulate expression of a NOGO receptor gene by RNA interference. The sinAs may or may not comparise ribonucleotides, can contain deoxyribonucleotides, can be chemically modified and may be double or shagle stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense regions, or alternatively are assembled from a sense oligonucleotide and may be compositions comprising an sinA targeted from NOGO receptor minAn. It interfering RNA (shRNA). The invention also relates to pharmaceutical compositions comprising an sinA targeted to a NOGO receptor gene, sinAs targeted to a NOGO receptor gene, sinAs targeted to a NOGO receptor gene, sinAs targeted to a NOGO receptor gene itself, and expression vectors and host cells comprising an sinA of the invention. In particular, the invention discloses siRNAs (AEF75903-AEF76100 and AEF76101-AEF76110. targeted to the human NOGO-A (KIAA0886) gene of DDBU accession number BO011787, and siRNAs (AEF75903-AEF76100 and AEF76101-AEF76101) targeted to the human NOGO-A (KIAA0886) gene of DDBU accession number AB020693. The siNAs are used to modulate expression of NOGO receptor or NOGO genes in cells, tissue explants or organisms (e.g., by carriety of neurodegenerative conditions such as central nervous system (CNS) injury (e.g., spinal cord injury or stroke), multiple sclerosis (AES), active organisms (e.g., spinal cord injury or stroke), multiple sclerosis (AES), active are also be used in drug screening, diagnosis, therespounds are also be used in drug screening, diagnosis, therespounds are also be used in drug screening, diagnosis, therespector are also and especially Alzheimer's condition and condition, genetic emplayed and and apprinted and especially and organisms of the parametery of the sinAtive organism or and validation, genetic emplayed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nervous system injury; spinal cord injury; neuroprotective; vulnerary; cerebrovascular ischemia; cerebroprotective; multiple sclerosis; muscular dystrophy; muscular-gen.; neuropathy; motor neurone disease; CNS-gen.; ataxia; Parkinsons disease; antiparkinsonian;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of a human NOGO receptor-targeted double-stranded siRNA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         which is identical to the NOGO receptor transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RNA interference; gene silencing; short interfering RNA; siRNA;
RNA interference (RNAi), useful for modulating gene expression

The invention relates to chemically synthesized short interfering nucleic acids (sinNa) which downregulate expression of a NOGO receptor gene by RNA interference. The siNAs may or may not comprise ribonucleotides, can contain deoxyribonuclectides, can be chemically modified and may be double or single stranded. They further comprise sense and antisense cligonuclectide. Specifically, the sinAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The invention also relates to pharmaceutical compositions comprisitions comprisitions comprisitions and short clutcher discloses siNAs targeted to a NOGO receptor gene, siNAs targeted to a NOGO receptor gene of GenBank accession number BC011787, and siRNAs (ABF75903-ABF76100 and ABF76101-ABF76112) targeted to the human NOGO receptor gene of GenBank accession number BC011787, and siRNAs (ABF75903-ABF76100 and ABF76101-ABF76112) targeted to the human NOGO receptor or NOGO genes in cells, tissue explants or organisms (e.g., by creeptor or NOGO genes in cells, tissue explants or organisms (e.g., by creeptor or NOGO genes in cells, tissue explants of or the treatment of a variety of neurodegenerative conditions such as central nervous system (CNS) injury (e.g., spinal cord injury or stroke), multiple sclerosis (MS), muscular dystrophy, chemotherapy-induced neuropathy amyotrophic disease, dementia, Creuzfeldt-Jakob disease and especially Alaheimer's disease. The sinAs may also be used in drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, therapeutic target identification and validation, genetic engineering, therapeutic target identification and gene mapping (e.g., of therapeutic parget identification and gene mapping (e.g., of therapeutic target identification and sendence and especially Alaheimer's therapeutic target identification and sendence and engi
                                                                                                                                                                                                                                                                                                              chemically modified double stranded short interfering nucleic acid NAA) molecule that directs cleavage of a NOGO receptor (NOGOr) RNA via
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transgenic plants; altered petal colour; polymerase chain reaction; ss.

Analysis of cDNA and gene expression - by amplification of mRNA followed
and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 double-stranded conns. by using an aggregate of mRNAs and a plural type clabelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction erayme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

Analyzing target nucleic acid sequences, useful for population genetics, drug development and diagnosing cancer, comprises hybridizing triple forming oligonucleotide and probe to target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is a second reverse phase triplex forming oligonucleotide, RP-TFO (3' to the SNP) used to analyse Factor V Leiden SNP using the method of the invention. The invention relates to analysing target nucleic acid sequences comprising restricting isolated DNA, hybridising at least one triplex forming oligonucleotide (TFO), adding a 3' to 5' exonuclease to form a protected nucleic acid sequence (PNAS) tail structure, hybridising the captured structure with a single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                       /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                  A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) the double-stranded contact aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                     Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          reverse phase triplex forming oligonucleotide, RP-TFO;

```
polymorphisms (SNP) identification probe and determining the SNP score. The methods can be used for analysing target nucleic acid sequences, especially genomic DNA sequences, to determine if they contain SNPs or short tandem repeats (STRs). The methods can be used to detect SNPs for use in population genetics, drug development, forensics, cancer, genetic disease research, genomic analysis, diagnostics and therapeutics in humans, plants and animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analyzing target nucleic acid sequences, useful for population genetics, drug development and diagnosing cancer, comprises hybridizing triple forming oligonucleotide and probe to target sequence.

The sequence is a second reverse phase triplex forming oligonucleotide, RP-TFO (3' to the SNP) used to analyse Factor V Leiden SNP using the method of the invention. The invention relates to analysing target nucleic acid sequences comprising restricting isolated DNA, hybridising at least one triplex forming oligonucleotide (TFO), adding a 3' to 5'

```
structure, hybridising the captured structure with a single nucleotide polymorphisms (SNP) identification probe and determining the SNP score. The methods can be used for analysing target nucleic acid sequences, especially genomic DNA sequences, to determine if they contain SNPs or short tandem repeats (STRS). The methods can be used to detect SNPs for use in population genetics, drug development, forensics, cancer, genetic disease research, genomic analysis, diagnostics and therapeutics in humans, plants and animals

preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antinfilamentory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO antisense gene therapy. The composition is useful for treating or ftp.wipo.int/pub/published\_pct\_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 4788; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antinfilammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a

preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory selected in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO Sequence 20 BP; 18 A; 0 C; 0 G; 2 T; 0 U; 0 Other; at ftp.wipo.int/pub/published\_pct\_sequences Query Match 88888888888888888

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 14292; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 and semonic flanking regions, 5 and 3 intron-exon junctions, or regions within 2.10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or ansal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antialergic, antiaethmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a

use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, receptor, producing pronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/published\_pct\_sequences

Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 3508; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprolesses (c) and elivery of the invention as antiallargic, antinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or maligonal disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition and sheases or condition and/or bronchoconstriction and/or lung and sheases or condition such as pulmonary obstruction, and/or bronchoconstriction are associated condition and asserting and asserting and in allergies and/or such as pulmonary or section. transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted truncleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 2923; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, confidence are derived from a gene encoding or regulating reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung advice, in separate containers, (b) the oligonucleotides, (c) instruction and adding carrier and for use of the kit. The composition of the invention has antiallergic, antiniflammatory, antiathmatic, is a classification and expression of the inventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, and or cancer. The reduced adenosine content of thoractive pulmonary disease, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc. tissue environment and thereby, to it its prevent any unwanted effects due to it

```
The present invention relates to an oligonuclectide anti-sense to e.g.,
initiation codon, coding region with 2-10 nuclectides of 5'-end and 3'-
end of nucleic acid target comprising gene(s) chosen from e.g.
interleukin (IL)-4 receptor, IL-5 receptor or salts of the
coligonuclectide and optionally surfactant operatively linked to the
oligonuclectide. The method is useful for preventing or treating a
respiratory or lung disease, which involves administering to the airways
of subject an effective amount of an inhibitor. The oligonuclectide is
useful for production of a medicament for the prevention and/or treatment
of a subject an effective amount of an inhibitor. The oligonuclectide is
consen from alrway inflammation, allergy(ses), asthma, impeded
chosen from alrway inflammation, allergy(ses), asthma, impeded
consen from alrway inflammation, allergy(ses), asthma, impeded
(CODP), allergic rhinitis (AR), acute respiratory distress syndrome
(ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway
obstruction. The present sequence represents an oligonuclectide of the

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound compositions with and inhibits the expression of Nav1.3. The specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuropathy, arthritic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                           Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                            Chimeric phosphorothioate oligonucleotide to target Nav1.3 #1981

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothhoate oligomicalectide with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding abav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disoater such as childhood seizure disoater, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MoE wings and a deoxy gap. Used during the antisense inhibition of different regions of the human Navi.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; osotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se.
                                                                                                                                                                                                                                                              New antisense compound targeted to a nucleic acid molecule encoding bay1.3, useful for useful for reating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, ophthalmological, immunomodulatory and cardiavascular activities, and can ophthalmological, immunomodulatory and cardiavascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL) -4 receptor, interleukin (IL) -5 receptor, CCR1, CCR3, Edeaxin, RANTES, MCP4, CD23, ICAM, WCAM, CCCR3 relates to a method of screening a candidate compound that binds to an enchance of screening a candidate compound that binds to one or more nucleic acid target(8) or expressed product(8), for the prevention and/or treatment of a respiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a cent or mRNA encoding interleukin 4 receptor, interleukin-5 receptor, CCCR1, CCR3, Ediaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or asthma and/or lawels of adenosine A receptor(8), and/or asthma and/or lawels of adenosine A receptor(8), and/or asthma and/or lawels of adenosine A respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cyptic fibrosis (CP), chronic obstructive pulmanaty or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cyptic fibrosis (CP), chronic obstructive pulmonary disease (COP), chronic obstructive pulmonary disease (COP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0.7%; Score 19; DB 1; Length 20;

The invention relates to an isolated human polynucleotide. The composition and methods are useful for screening, diagnosing or treating breast cancer. These may also be used in drug screening or in monitoring disease progression and/or treatment efficacy of breast cancer. The present sequence represents a human small inducible cytokine B14 precursor breast cancer marker cDNA.
Cytostatic; Gene therapy; diagnosis; breast tumor; endocrine disease; gynecology and obstetrics; neoplasm; ss; tumor marker.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of amplifying an unclonable DNA fragment in vitro for transfection into a eukaryotic cell which comprises amplifying the unclonable DNA fragment by rolling circle amplification (RCA) to produce a tandem series of repeate of the unclonable DNA fragment. The vector is used in therapy, specifically in gene therapy, which may be for unscular dystrophy and for DNA expression studies. The method and kit are useful for amplifying an unclonable DNA fragment in vitro. The present sequence represents an oligo (dT)20 primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Amplifying an unclonable DNA fragment in vitro, useful for transfecting into a eukaryotic cell, comprises amplifying the fragment by rolling circle amplification.

gene expression - by amplification of mRNA followed

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GBNESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The

                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method (M1) for labeling double stranded nucleic acid for efficient detection of DNA or RNA. The method comprises using a carbodininde derivative for labeling one or more of thymine, uracil and guanine, which exists in the mismatch region of the double stranded nucleic acid or its vicinity, or unstable region of the hydrogen bond of the double stranded nucleic acid. (M1) is useful for labeling double stranded or single stranded nucleic acid or detecting single nucleocide polymorphisms. The present sequence was used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                            Labeling double stranded nucleic acid, involves utilizing carbodiimide derivative for labeling thymine, uracil and guanine, which exists in mismatch region of nucleic acid or unstable region of hydrogen bond of nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                        Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESSOR files AAQ7554.7075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                 Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        double-stranded cDNAs, using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abablled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      method for the analysis of cDNA comprises (a) preparing an aggregate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Jene expression; reverse transcription; primer; cDNA; restriction enzyme; ss.

ö A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-CD5798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily 당당 gene expression - by amplification of mRNA followed - by amplification of mRNA followed A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESGA files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides (b have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LMA) and the anchor region comprises are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The agents are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, ceramic, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (blo) molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, conducting properties and electrical field or through a molecular, hair method is used (i) for analysis of patterns, especially in mucosal, cation is physical, stimulated by an electrical field or through a molecular or additives or supplements, especially minerals, trace elements, organic acids find and activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids find matrix in an acid competed and inacpeted acid in a cell, and can be acids matrix miniaturisation is possible. useful for analyzing expression uses capture agent with variable Sorting single-stranded nucleic acid, patterns and screening active agents, and constant regions.

Example; Page 4; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture cadents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable anthor region. The complement of which is present at least once in each nucleic acid and a 3' variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture of particularly locked nucleic acids (LMA) and the anchor region comprises are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by compuring properties are biotinylated and immobilised on a surface capture cliquoucleotides are biotinylated and immobilised on a surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cativity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, race elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells.

allows imaging of the complete pattern of all nucleic acid in a cell, a can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention. Sequence 21 BP; 3 A; 0 C; 0 G; 18 T; 0 U; 0 Other; 888888

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 6; 8pp; German.

This invention describes a novel method for sorting single-stranded conclet acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture cadents that are (a) immobilised on the surface of a solid matrix and (b) agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides comprises and non-variable region, the complement of which is present at that comprises all possible combinations of up to 10 nucleotides to allow that comprises a sequence of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, interacting properties and especially in the form of a chip. Ints surface conducting properties and especially in the form of a chip. Ints stranded nucleic acids to the surface is (quasi) covalent, supramolecular, stranded nucleic acids to the surface is (quasi) covalent, supramolecular, chair root, blood, nerve or germ cells and (i) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides comprises as 5-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, interaction with streptavidin. The matrix is of plastic, ceramic, glass, interaction with allowed and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface is sparticularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular,

physical, stimulated by an electrical field or through a molecular sieve. The method is used (1) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (1) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid pool. Since the method is based on comparison of nucleic acid pool. Since the method is based on comparison of nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5' invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (IMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass,

metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible corpresentation of differences in pools of nucleic acid in a cell, and can detect very small differences in the nucleic acid in a cell, and can detect very small differences in the nucleic acid pool. Since the genes, matrix miniaturisation is possible. ADK01344 represent capture probes used in the method of the invention. 25555555555555555555888

The invention relates to a method for modulating, in a host cell, a protein-protein inceraction between a first protein which is PRAK (P38-corotein-protein inceraction between a first protein which is PRAK (P38-corotein-protein kinase or MAPKAPK5) and a second protein comparises administering to the cell a compound capable of modulating the protein-protein interaction. The method is useful in modulating in a host protein-protein interaction between a first protein which is PRAK and a second protein which is ERK3 for treating inflammation or inflammatory disorders, e.g., asthma, rheumatoid arthritis, myositis, Crohn's disease, gastritis, colitis, colitis, ulcerative colitis, inflammatory bease, systemic lupus erythematosus, rhinitis, colitis, seleritis, chronic inflammatory polymouropathy, Tertiary Lyme disease, psoriasis, dermatis or eczema. The present sequence represents an siRNA (short interfering RNA) oligonucleotide targeting the continction in the seemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modulating, in a host cell, a protein-protein interaction between first protein, PRAK, (MAPKAPKS) and second protein, ERK3, (extracellular signal-regulated kinase 3) by administering modulating compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protein interaction; short interfering RNA; siRNA; RNA interference;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                        This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid bools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonuclectides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture of 10-50, particularly 15-25, T residues. The capture of 10-50, particularly 15-25, T residues. The capture comprises a sequence of (b) oncloid surface and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface to stranded nucleic acids to the surface is (quasi) covalent, supramolecular, is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucceal, cacids in a cells. It and matrix of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid pool, since the method is based on comparison of nucleic acid pools not individual cacuture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein interaction; short interfering RNA; siRNA; RNA interference; gene silencing; ds.

```
The invention relates to a method for modulating, in a host cell, a protein-protein interaction between a first protein which is PRAK (P38-cegulated/activated protein kinase or MAPRAPS) and a second protein which is ERK3 (extracellular signal-regulated kinase 3). The method comprises administering to the cell a compound capable of modulating the protein-protein interaction. The method is useful in modulating in a host cell a protein-protein interaction between a first protein which is PRAK and a second protein which is ERK3 for treating inflammation or inflammatory disorders, e.g., asthma, rheumatoid arthritis, modulating, invenile chronic arthritis, mostils Crohn's disease, proctitis, colitis, ulcarative colitis, inflammatory bowel disease, proctitis, pelvic inflammatory disease, systemic lupus erythematosus, rhinitis, collitis, coll

The invention relates to a method for modulating, in a host cell, a protein-protein interaction between a first protein which is PRAK (P38-cegulated/activated protein kinase or MAPKARKS) and a second protein which is ERK3 (extracellular signal-regulated kinase 3). The method which is ERK3 (extracellular signal-regulated kinase 3). The method comprises administering to the cell a compound capable of modulating the protein interaction. The method is useful in modulating in a host cell a protein-protein interaction between a first protein which is PRAK inflammatory disorders, e.g., asthma, rheumatoid arthritis, juvenile chronic arthritis, myositis, cabhma, rheumatoid arthritis, juvenile chronic arthritis, myositis, crohn's disease, gastritis, colitis, ulcerative colitis, inflammatory bowel disease, proctitis, pelvic conjunctivitis, scleritis, chronic inflammatory polyneuropathy. Tertiary Lyme disease, psoriasis dermatitis or eczema. The present sequence copresents an siRNA (short interfering RNA) oligonucleotide targeting the KV70 transcript, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modulating, in a host cell, a protein-protein interaction between first protein, PRAK, (MAPKAPKS) and second protein, ERK3, (extracellular signal-regulated kinase 3) by administering modulating compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Fig 49; 296pp; English.

The invention relates to a novel isolated protein complex having a first protein interacting with a second protein. The invention further comprises: a protein microarray comprising the protein complex; a method of selecting modulators of the protein complex; a method of selecting modulators of the protein complex; a method of selecting modulators of an interaction between a first protein and a second protein complex as an analyor preventing of diseases and disorders associated with the protein complexes. The protein complexes are useful in screening assays for identifying compounds effective in modulating the protein complexes, and in treating and/or preventing diseases and disorders include cancer, adenomatous polyposis, isofamena, stroke, autoimmune diseases, diabetes, coronary heart disease, neurodegenerative diseases, asthma, inflammatory disorders, sepsis, seteleptorosis, obesity, viral infection, AIDS, glomerulonephritis, atherosclerosis, and muscular dystrophy. This sequence represents an siRNA oligo which targets the transcript of a protein forming part of a protein-protein complex of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
